ADAM SYSTEM 2 QUANTITATIVE RISK CONTROL // SPECIAL DUAL-PLANE BRIEFING

DATE: SEP 23, 2026	REGIME: HAWKISH REPRICING	S&P 500: 7,706.03 (-0.75%)	10Y TREASURY: 5.11% (+0.15%)	BTC: \$86,965.21 (+1.83%)
--------------------	---------------------------	----------------------------	------------------------------	---------------------------

SECTION 1: THE VISUAL METAPHOR

To evaluate institutional credit risk and Broadly Syndicated Loans (BSL) under SR 11-7 regulatory capital frameworks, we contrast the baseline reality against a cascading geopolitical duration shock. Below, two distinct visual metaphors frame the risk landscape:

IMAGE 1: BASELINE MODEL (HAWKISH CLEAR SKIES)

IMAGE 2: CHALLENGER MODEL (OP. ABSOLUTE RESOLVE)

Figure 1.1: The Baseline depicts pristine liquidity where yield expansion is orderly and asset valuations remain insulated. Conversely, the Challenger model simulates a liquidity shock & duration conflagration in an illiquid backdrop.

SECTION 2: DUAL-PLANE DATA HARNESS & CREDIT MECHANICS

Under **Operation Absolute Resolve**, a multi-day rolling geopolitical liquidity shock originating from regime extraction in Venezuela induces acute duration expansion across US Treasuries and Broadly Syndicated Loan (BSL) credit spreads.

Asset / Credit Instrument	Baseline Level	Challenger Shock (Peak)	Spread Impact	SR 11-7 Capital Status
US 10-Year Treasury Yield	5.11%	5.65%	+54 bps	Compliant (Tier 1 Buffer)
BSL Broad Index Spread	385 bps	490 bps	+105 bps	Pass (Buffer Triggered)
SIM-HY-CREDIT Portfolio	\$1.24B Nav	\$1.147B Nav	-7.5% Drawdown	Advisory Review
Bitcoin (BTC / USD)	\$86,965.21	\$79,200.00	-8.9% Liquidity Drain	Unencumbered

Thesis Resilience Note: While SIM-HY-CREDIT experiences an immediate -7.5% drawdown during the peak liquidity contraction on Day 4, the localized shock dissipates as collateralized debt obligation structural protections hold. This marks the comeback chapter in our long-term institutional credit thesis, confirming that underlying core obligor cash flows survive the immediate localized duration shock without triggering systemic solvency impairment.

MARKET MAYHEM (CONT.)

SECTION 3 & SECTION 4 // ADJUDICATION & PROV-O AUDIT TELEMETRY

SECTION 3: LLM-AS-JUDGE ADJUDICATION ENGINE

The Adam Deterministic Rule Engine evaluates model divergence using strict jsonLogic rules over 4-clock temporal geometry. The adjudication validates that the flight-to-quality in the Challenger model correctly overrides the baseline hawkish trajectory during Days 2–5 while maintaining long-term underwriting integrity.
